

## CLAIMS

1. A coating composition curable by active energy rays which composition contains a siloxane compound (A) obtainable by the hydrolysis and condensation of an alkyl silicate expressed by the following general formula (1)

5

wherein R<sup>1</sup>, R<sup>2</sup>, R<sup>3</sup>, and R<sup>4</sup> represent an alkyl group having 1 to 5 carbon atoms or an acyl group having 2 to 4 carbon atoms, respectively, and n indicates an integer from 3 to 20,

10 and a cation polymerization initiator (B) having a sensitivity to the active energy rays.

2. The coating composition curable by active energy rays according to claim 1 wherein the composition further contains an epoxy compound (C).

15 3. The coating composition curable by active energy rays according to claim 1 wherein the composition further contains a vinyl compound (D) having, in the molecule, a group having polymerizable double bond, and a radical polymerization initiator (E) having a sensitivity to the active energy rays.

20 4. The coating composition curable by active energy rays according to claim 1 wherein the composition further contains an epoxy compound (C), a vinyl compound (D) having, in the molecule, a group having polymerizable double bond, and a radical polymerization initiator (E) having a sensitivity to the active energy rays.

5. A method for forming a protective film by applying a coating composition defined in any one of claims 1 to 4 on the surface of a substrate and then irradiating active energy rays to the composition to form the protective film.
